

Technical Artist Assessment

Overview

This assessment is divided into two parts and is designed to evaluate your skills in 3D content creation, real-time rendering, optimisation, and data integration within a game engine. You may complete the task in either Unreal Engine or Unity.

Part 1: 3D Animation Recreation

Objective

Using only 3D elements, recreate the animation shown in the reference video (Animation.mkv). The final result should closely match what is depicted in the reference. Reference images are also included in the provided ZIP archive and may be used as textures.

Constraints

- Maximum of 100 triangles in the scene, the fewer the better.
- Textures must not exceed 1024 × 1024 pixels.
- Objects must support transparency.

Deliverables

- A Windows build of the project.
- The project files packaged in a .zip archive.
- A short written description of your production process.

Part 2: CSV-Driven Animation

Objective

Inside the Data folder you will find two CSV files containing sample data. Parse this data into Unity or Unreal and use it to drive the animation you created in Part 1, applying it to the corresponding object(s) based on the values in the files.

Notes

- State 4 is open to interpretation. Feel free to represent it however you wish.
- Processing the Long Data file is optional.
- Creativity is encouraged. Feel free to bring your own vision to the task.
- If you have access to VR goggles, using them is an ideal way to develop and experience the result.

Good luck. We look forward to seeing your work.
